INDUSTRIAL VISIT TO JCORP

INTRODUCTION

On 7 January 2026, a group of students from Data Engineering Course, University of Technology Malaysia conducted an industry visit to Johor Corporation(JCorp) at its office in Johor Bahru, Johor. The visit was organised by SECP1513 Technology and Information System.

The purpose of this visit was to expose students to real-world industrial practices, particularly how large organisation leverages computer-assisted systems,

cloud computing, data analytics and artificial intelligence(AI) to support business operations and decision-making,. Throught an in-depth sharing session by JCorp's staff, students gained valuable insights into the organisation's digital transformation journey and the role of technology in modern enterprises.

Company Background

Johor Corporation (JCorp) is a Johor state government statutory body that drives the state's economic development. Jcorp was established in 1968. Being a strategic investment holding firm, JCorp operates in healthcare, agribusiness, food & beverage and property. It plays an crucial role in promoting sustainable development in Johor and strengthening its position in the regional economy. JCorp also adopt digital technologies like cloud and data analytic to enhance productivity and decision-making.

- **Understanding computer-assisted systems at JCorp**
Understand cloud computing, enterprise systems, AI, and automation technologies, which improve efficiency, productivity, and service delivery.
- **Exposure to integration of computing, networking, and data technologies**
Understanding how IT infrastructure, networks, and analyses, and AI systems integrate in the digital domain.

Objective of Industry Visit

- **Close-up exposure to JCorp operations**

This is where one will observe the operations of the company in handling the different portfolios that the group operates.

Key Observations & Technical Insights

Type of Computer System

During our visit, we acquired a clear understanding that JCorp has move on far beyond traditional local servers. We learned that they are operating on Unified Platform Architecture. It was impressive to see how they make use of major platforms like Google Cloud, Microsoft Azure, and AWS simultaneously. This approach allows them to pick the best solution and environment for certain tasks, especially for high-performance computing. We learned that their focus on edge computing, which processes data closer to where it is collected before sending it to the cloud are very useful for improving efficiency. This architecture is clearly designed to support the massive computational power needed for their future AI capabilities.

Enterprise systems

In terms of optimizing routine operations , we observed that JCorp incorporate software like SAP, Microsoft Dynamics 365, Workday, and ServiceNow. However, what really shine out to our group was how they are not just using these systems in isolation. JCorp implementing an "Application Layer" that link everything up with standard APIs. By doing so , "Gen-BI" or Generative Business Intelligence ecosystem can be achieved. It was fascinating to learn about their vision for a future Command Centre that will automate workflows across departments like Finance and HR, reducing the amount of manual low-value work employees have to do.

The evolution of data management at JCorp was inspiring for us. A clear progression was seen from a Data Mess to valuable Data Products, facilitated by tools like Azure Synapse and Data Factory. We were drawn to the Foundation Layer, which is Milvus as a vector database being utilize to improve AI. The architecture was used as a practical model of Data Mesh, successfully balancing distributed ownership with centralized control.

Use of databases, system where applicable

Learning Outcomes

Johor Cooperation (JCorp)

Through the industrial visit, an understanding was gained of how computing is integrated with business across different sectors of large organizations. Knowledge was acquired regarding JCorp's digital strategy, which emphasizes processes, innovation, and artificial intelligence (AI), and it was recognized that digital transformation enhances both technological capabilities and work practices. JCorp's Digital Transformation (DTX) journey was used to illustrate key concepts, including cloud computing, enterprise architecture, and data analytics. A cloud-first approach was initially adopted by JCorp, followed by the implementation of RITE and MilaRITE. In addition, AI tools such as Copilot were leveraged, archives were digitalized, AI Ops and ServiceNow were introduced, a JCorp AI LLM was launched, and plans were established for the development of a Command Centre by 2026. This progression demonstrated how enterprise systems evolve gradually over time. Furthermore, awareness of interdisciplinary collaboration was strengthened, as effective solutions are delivered through cooperation between IT teams and business and management units. It was also learned that computing professionals are required to maintain a balance between technical expertise and business perspectives.

Skills and Knowledge Development

All critical engineering practices, including data management, AI systems, automation, dashboards, and enterprise platforms, were observed by the students. In addition, initial exposure was provided to data mesh, analytics, and monitoring solutions, which demonstrated how data are transformed into business value. Understanding of soft skills, such as communication, teamwork, and professionalism, was also enhanced through the visit. Furthermore, the importance of governance, documentation, and system monitoring was recognized, particularly as they are applied through established industry standards.

Relevance to Academic Studies and Career

The trip supported students in the preparation of coursework in Technology and Information Systems, as repeated demonstrations clarified the academic relevance of key concepts. Career awareness was also developed for roles in enterprise systems, data engineering, and industrial computing. In addition, students were encouraged to use AI tools, develop hands-on projects, and actively share learning experiences to enhance employability.

Conclusion

Overall, the JCorp industrial visit provided meaningful insight into how computing supports business and industry. The gap between theory and practice was bridged, while preparation for professional expectations was strengthened. In addition, technical competence, confidence, and career motivation were further developed through industry exposure.

Acknowledgement

Sincere appreciation is extended to Johor Corporation (JCorp) for the valuable sharing and warm hospitality provided. Appreciation is also conveyed to the lecturer, Dr. Aryati, and the staff of JCorp for their contributions to the successful completion of the visit.
